

# DRYFIRE ROOM SETUP

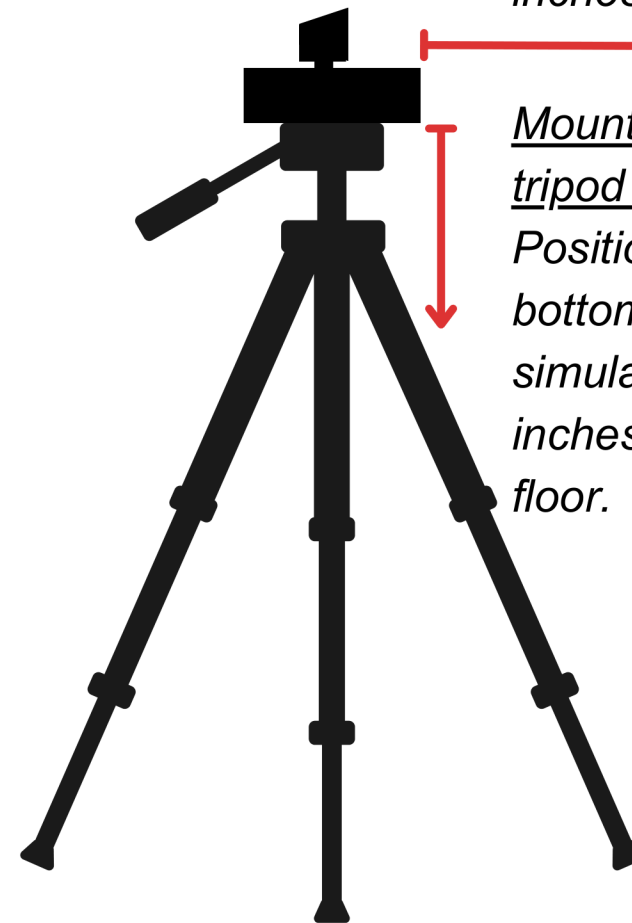

Set the height of the canvas background shooting screen's horizon level with your eye line. It doesn't need to be exact & can be the rough average of a team's eye line.\*

*Ceiling mounted: 7-9 feet from the floor*

*Position the front of the simulator 50 inches from the shooting surface.*

*Mounted on a tripod or stand:  
Position the bottom of the simulator 50 inches from the floor.*

*Position the top of the traphouse to where the targets are originating.\*\*\**

**Shooter position\*\*:**

*Skeet = 7 feet from shooting surface*

*Trap, Sporting, Bunker = 8-12 feet from shooting surface*

\*The placement of the canvas background screen will not affect how the target (laser) flies.

\*\*The DryFire software will guide you through setting up each shooter station.

\*\*\*The traphouse is mounted with magnets and is movable. The laser should be "thrown" from the top of the traphouse.
